

Releases in April, building a platform for scaling companies

We want our partners and end-users to experience gradual, but significant improvements. Piece by piece we're building a future-proof solution, fast enough to handle even larger and more complex customers.

At Visma, we're on a mission to build the best ERP platform for scaling companies, keeping our customers ahead of the competition by accelerating their productivity in an ever-changing market.

That's why the journey of increasing the performance in Visma.net ERP continues. Features and improvements are influenced by our customers, partners, industry trends, and regulatory requirements. Reaching a full scaling and maximum performing application in all corners and for all selected target industries, will not happen overnight. Our promise is to keep customers in focus and step-by-step get our customers covered with relevant and prioritized updates.

Adopting the connected experience

Customers in medium and large sized companies have more than one application to run their business. Data from [Blissfully](#) shows that the typical 200-500 person company uses 123 apps, and the complexity grows with the number of employees. We're

enabling Visma.net ERP for integration partners and making it even more easy to collaborate with suppliers, customers and employees through well performing API integrations.

One example is last month's improvements to the API endpoint for supplier invoices, which were happily received by early adopters. As one of our partners stated:

"For our customer, importing 51 000 supplier invoices usually timed out after 4 hours, now it's completely done in 12 minutes!"

Let's review the highlights for April!

Boosting the performance for scaling customers

The *import scenarios feature for purchase invoices* has improved significantly, it's now running 2 times faster. Some of our customers and partners gave instant hurras:

"The import of our almost 6000 invoices is now done in 3 hours. That is a substantial improvement! We're very happy with the overall improvements, we're confident that we choose Visma as our supplier. Thank you very much, for all your efforts"

Secure and efficient integrations of payments are essential for any business. The *processing of bank transactions* (through the screens processing bank transactions and processing incoming payments) has become 3 times faster, which saves a lot of time for the accountants.

Speaking of the accountants, the window for *general ledger transactions with VAT* has been trimmed. The screen now loads data up to 4 times faster, and the usability has been improved. The filter for sub-accounts now allows filtering on segments, which will be a real timesaver.

Simplifying the daily life for accountants

One of our goals for the accountant users is to move away from repetitive and unnecessary administration, making more time to focus on value bringing tasks.

Allow us to introduce improvements to help our users be more efficient.

The usability of the screen for *converting purchases to assets* has been improved. To simplify for the user, only purchases that should be converted are shown, the rest is left out.

In the Netherlands, *the sending of the VAT report* is tuned, the rounding of certain amounts and the telephone number is formatted in a better way. This will result in fewer VAT reports being rejected due to format errors.

In Norway, *the process of creating and sending the VAT report* is improved. Multiple smaller fixes have been made to streamline the usability.

Partners and integrators often use the *API for creating journal transactions*. It has now become even easier to use as it's not necessary to send values for all segments of a sub-account anymore, just the ones that are relevant. The other segments will automatically get default values.

Working with logistics or project management? We got you covered.

Earlier, in some circumstances, there was an issue with *creating returns with replacement orders* - the RR order type. This process is now updated to make the handling of replacement orders as easy as possible.

Project managers want flexibility, and sometimes you have to change a project id. When doing so in Visma Project Management, the id will be automatically synced to Visma.net ERP. This will save a lot of time and improve the daily work of project managers.

What's up next?

We want our partners and end-users to experience gradual, but significant improvements. Piece by piece we're building a future proof solution, fast enough to handle even larger and more complex customers by speeding up the API integrations, screens, and reports. And to set our customers' business on autopilot, we're automating as many of the daily tasks as possible.

Next up is to improve the *service for processing outgoing payments*. The workflow is streamlined, it's getting a lot faster and we're about to release full support for multi-branch and inter-branch transactions. The functionality is in place and we are just about to start a first real-life test with pilot customers.

With the new process payment service, we promise our customers will be able to increase the quality of their work and get even more productive.

Continuous updates and step-by-step improvements

This is just the tip of the iceberg, head over to our community pages for a look at all April updates. Until next month, stay alert for the weekly updates, helping our customers to simplify their business processes.
